

SMART INDIA HACKATHON 2026

TATPAR

तत्पर • “ever-ready”

Readiness Assurance Platform for Air Fleets

Others predict failures. TATPAR assures readiness.

AI prognostics • sustainment digital twin • fleet optimisation • offline & sovereign

PROBLEM STATEMENT ID

26249

PROBLEM STATEMENT TITLE

Air Power – Predictive Maintenance & Fleet Availability

ORGANISATION

Ministry of Defence • Defence Services Staff College

THEME

Transportation & Logistics

PS CATEGORY

Software

TEAM ID

To be filled

TEAM NAME

To be filled

Proposed Solution

TATPAR joins health monitoring, technical records, spares and repair-agency data, then plans flying, maintenance and spares so that the required number of aircraft is mission-capable on the day of need — with stated confidence.

“How many aircraft on day D — and how sure?”

Readiness Forecast

A Fleet Twin of aircraft, spares, BRD/HAL repair pipeline, bays and manpower runs 200 Monte-Carlo futures → P10-P90 aircraft per day and P(meet task).

“What must I do today to have N ready?”

Readiness-Backward Planner

Optimises flying hours per tail, check timing, spares transfers, depot priority and cannibalisation; shows each action's readiness gain; a human approves.

“Where is readiness lost — and why?”

Readiness-Loss Waterfall

Aircraft-days lost to spares, scheduled and unscheduled work, depot and manpower, with the days each lever could recover.

What is unique

Twin of the sustainment system — not a 3D model of one aircraft

Calibrated RUL — conformal 90 % intervals + engine-module attribution

Prognostics-aware flight & maintenance planning — staggered checks, bundled repairs

Multi-echelon spares (VARI-METRIC) fed by predicted demand

No-Fault-Found, rogue-unit & cannibalisation analytics

Indian base environment severity from real dust data; offline & federated

Technical Approach

TATPAR — Readiness Assurance Architecture

Integrate → Predict (calibrated) → Simulate (Fleet Twin) → Optimise → Assure → Learn · runs fully offline

Technology stack

Prognostics

LightGBM quantile + conformal (CQR), SHAP, Weibull AFT (lifelines)

Twin & optimisation

NumPy Monte-Carlo Fleet Twin, OR-Tools CP-SAT, VARI-METRIC

Platform

FastAPI · React + TypeScript · ECharts · SQLite → Postgres/TimescaleDB

Data

NASA C-MAPSS, MaintNet logbooks, CAMS dust, notional synthetic fleet

Deploy

Docker, fully offline on CPU laptop / edge server

Integrate

Predict

Simulate

Optimise

Approve

Learn

Feasibility & Viability

+20 pts

mission-capable in the working prototype's Fleet Twin: 57.7 → 78.0 %, same fleet and spares budget (notional data)

90 %

calibrated engine-RUL interval coverage on NASA C-MAPSS test sets (82.7 % before conformal calibration)

0

cloud dependencies — runs air-gapped on a CPU laptop or edge server; public + synthetic data only

Challenge / risk	Mitigation built into TATPAR
No access to real IAF data	Public datasets + synthetic fleet with hidden ground truth; adapters for IMMOLS / e-MMS exports
Trust in AI recommendations	Calibrated intervals, explanations, human approval, hash-chained audit log
Classified, air-gapped networks	Fully offline; federated learning shares only model weights
Legacy and paper records	Common data model (S5000F / ATA), CSV adapters, data-quality scores
Optimisation run-time	CP-SAT plans a squadron in ~1–2 s; rolling horizon, per-squadron decomposition

01 State board + daily signal

02 Planning cell (P(meet) staircase)

04 Airframe: drawing + engine RUL

Working prototype built. Path to deployment: SIH prototype → pilot on one squadron's historical exports → BRD + IMMOLS integration → command-wide rollout.

Impact & Benefits

~40 %

of fighters reported unserviceable at any time
(post-Op Sindoor commentary)

20–70 %

of military avionics removals end as No-Fault-Found — wasted spares and repair slots

≈ 13

more aircraft mission-capable every day from a 64-aircraft fleet in the prototype twin — same spares budget (notional data)

Who benefits

Commander

N aircraft on day D, with a stated confidence

Squadron Engineering Officer

Which tails fly, which go in, what to bundle

Logistics Officer

What to stock, move or expedite — and where

BRD / Depot

Which repairs add the most readiness first

Operational

More aircraft from the same fleet; surge plans with known odds

Economic

Spares bought for availability per rupee; fewer NFF and repeat repairs

Strategic

Sovereign, offline software; supply-risk visibility for indigenisation

Safety & people

Fewer cannibalisations; chronic defects caught early

Gap analysis: 7 public PS-26249 projects reviewed (NIRANTAR, AERO-READY, AeroTwin-AI, AirPower, PREDIX, VAYU SEWA) — none model flight & maintenance planning, multi-echelon sparing or probabilistic readiness. Prototype figures use a notional fleet; no classified data.
